

How to Set Up a Shared Folder Between OSX and Windows (Fusion)

On the virtual windows side:

- 1 Select Virtual Machine > Settings
- 2 In the Settings window, in the System Settings section, select Sharing
- 3 Drag the Share Folders slider to ON
- 4 Click the add (+) button at the bottom of the display box
- 5 In the Finder sheet, find the location of the Shared Windows Folder, select it, and click Add
- 6 In the Permissions field, make sure it s set to Read&Write

This should create an alias on your PC desktop called "VMWare Shared Folders" that links to the folder on your mac side called "Shared Windows Folder".

If you would like to map that to a drive (which will be helpful later):

- 1 - go to the start menu and open computer
- 2 - Select 'Map Network Drive' in the bar menu of that window
- 3 - Leave the drive as 'Z:' (or whatever shows up)
- 4 - In the Folder field, type \\vmware-host\Shared Folders\
- 5 - check 'Reconnect at logon'
- 6 - Click Finish

When you go to the computer window you should see the new Z: drive.

Now, if you really want to make things easy, change the default directory in sas to the shared folder! (see Changing the Default Directory in PC SAS
